

S-matrix bootstrap: published target and current audits

He-Kruczenski, arXiv:2309.12402v3 | Independent progress toward numerical reproduction

A Finite-truncation scattering diagnostics

B Normalization and quark-mass conventions

Left: filled markers = optimal; hollow markers = optimal_inaccurate. No interpolation or continuum certification.

Independent sampled unitarity defects, $\max(|S|-1)$: $N=4$: 0.0063; $N=6$: 0.028; $N=8$: 0.044. Published markers are graphical data, not original solver outputs.

Right: deviations from rounded Eq. (2.56). Direct OPE contour agreement $\leq 4.8\text{e-}16$ in relative terms; this tests algebra, not physical QCD error.
